VEYN, M.A.

Arsenoxides in the therapy of syphilis. M. A. Veyn and M. A. Rozental. *Vestnik Venerol. i Dermatol.* 1945, No. 1, 18-21. Mapharsen (I), chloarsen (3-amino-4-oxyphenyldichlorarsen-HCl), and neohalarsin (hydrate of tartaric acid salt of 3-amino-4-oxyphenylarsenoxide, mol. wt. 384) are all hydrated in water to 3-amino-4-oxyphenylarsenoxide. This intermediate product in the synthesis of salvarsan, originally considered too toxic for therapeutic use, has been found to be effective against syphilis, producing fewer complications than neosalvarsan. I was used to treat 511 cases with different clinical degrees of syphilis. In the majority of cases spirochetes disappeared in 24 hours. Only minor complicating symptoms resulted. It is considered as effective against syphilis as novarsenol and is recommended for general use to supplement but not supplant novarsenol.

Physical properties of rocks and mineral resources of the USSR (Fizicheskiye svoystva gornykh porod i poleznykh iskopayemykh SSSR) Moscow, Izd-vo "Nedra", 1964. 325 p. illus., biblio. (At head of title: Gosudarstvennyy geologicheskiy komitet SSSR. Vsesoyuznyy nauchno-issledovatel'skiy geologicheskiy institut) 3000 copies printed. Under the editorship of G. M. Gapeyeva and N. B. Dortman; Principal editor: I. A. Kalmykova; Technical editor: A. S. Polosina; Proofreader: K. S. Toroptseva

TOPIC TAGS: magmatic rock, metamorphic rock, mineralogy, petrology, seismology

PURPOSE AND COVERAGE: This book is the result of the generalization of materials collected primarily by geophysical trusts and geologic agencies, as well as by the institute named (VSEGEI). Principal attention is paid to the basic laws governing variations in the physical properties of rocks, various petrographic groups, and useful minerals of divers mineralogic composition. The physical parameters to

TABLE OF CONTENTS:

Introduction - - 3
Part I. Physical properties of magmatic and metamorphic rocks
Ch. I. Physical properties of rock-forming minerals - - 9
Ch. II. Density of rocks - - 33
Ch. III. Magnetic properties of rocks - - 93
Ch. IV. Specific electrical resistance of rocks - - 172
Ch. V. Rate of propagation of longitudinal elastic waves in rocks - - 193
Ch. VI. Change in physical properties of rocks, depending on manifold pressure

AUTHOR: Veynberg, A. K.

TITLE: Determining the depth of differentiatedly magnetized beds by means of tangents

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 9, 1962, 37, abstract 9A245 (Inform. coll. Vses. n.-i. geol. in-ta, no. 45, 1961, 57-71)

TEXT: In fact, geologic bodies are generally magnetized inhomogeneously, whereas in the overwhelming majority of cases magnetic prospecting data are interpreted quantitatively on the supposition that the magnetization is homogeneous. The author examines a columnar deposit, composed of three differently magnetized vertical beds, and in this example estimates whether the depth can be determined to the deposit's upper edge by the method of tangents. In a number of cases the use of values, specified by the author for the factors of the tangent formula, resulted in good concurrence between the calculated depths and the true values. [Abstracter's note: Complete translation.]

Title: Selection of Cooling Agent

Original Periodical: Kholodil'n. tekhnika, 1956, No 1, 63-66

Abstract: A low value of ratio of condensation pressures to boiling point of refrigerant has a beneficial effect on the characteristics of the refrigerating machine since it permits in a number of instances to avoid 2-step compression or decrease the number of compression steps. With an increase in the number of compression steps in modern fully or partially automatic refrigerating machines, the complexity of the system increases sharply, the number of auxiliary apparatus increases, of greater complexity are automatic operation, starting of the machine, lubrication, regulation of liquid refrigerant, etc. On the basis of a

Abst Journal: Referat Zhur - Khimiya, No 19, 1956, 63927

Abstract: thermodynamic analysis of the properties of various refrigerants the following conclusions were reached: (1) refrigerants having low values of the critical temperature are characterized by low values of the ratio of condensation pressure to boiling at given temperatures; (2) it is advantageous to select refrigerants having low values of critical pressures; (3) for low temperature cascade refrigerating machines refrigerants should be selected in such a manner that pressure in the condenser of the lower side is sufficiently high; this permits to cover in the lower side the greatest interval of saturation temperatures.

PHASE I BOOK EXPLOITATION SOV/5343

Veynberg, Boris Samoylovich

Porshnevyye kompressory kholodil'nykh mashin (Piston Compressors for Refrigeration Machinery) Moscow, Gostorgizdat, 1960. 343 p. 6,500 copies printed.

Ed.: Ye. F. Maslova; Tech. Ed.: D. M. Medrish.

PURPOSE: This book is intended for engineers and technicians in refrigeration engineering, and for students in schools of higher education.

COVERAGE: Problems concerning the theory, design, and application of piston compressors in refrigeration units are examined. Particular attention is given to the following: the theory of the working process and intermittent operation, the selection of basic parameters, thermal design of piston compressors, balancing of the inertia forces, and the construction and design of compressor subassemblies and parts. Many examples have been included for

the purpose of facilitating an understanding of the more complex theoretical problems. An attempt has been made to systematize problems which arise in the designing of compressor prototypes for refrigeration units. The author thanks Professor L. M. Rozenfel'd, Engineer Ye. S. Gurevich, and the entire staff of the chair of refrigeration machinery at the LTIKhP [Leningradskiy tekhnicheskiy institut kholodil'noy promyshlennosti - Leningrad Technical Institute of Refrigerating Industry] for their observations regarding the book. There are 9 references: 7 Soviet, 1 English, and 1 German.

Oxygen in Cast Iron. G. Veynberg. (Stal, 1940, No. 8, pp. 38–41). (In Russian). Analyses by the author showed that grey cast irons produced by using coke fuel contained from 0·018% to 0·027% of oxygen; foundry irons produced with charcoal in the blast-furnace contained from 0·014% to 0·019% of oxygen; Swedish charcoal foundry irons from 0·013% to 0·016% of oxygen; iron castings from 0·038% to 0·054% of oxygen and malleable cast iron from 0·014% to 0·027% of oxygen. In a series of foundry cast irons the oxygen content tended to increase with the silicon content whilst the manganese content did not exert any obvious influence. In blast-furnace metal the oxygen content tended to increase with increasing pressure and temperature of the blast. Values for the oxygen content of different cast irons obtained by previous investigators are summarised and reference is also made to the hydrogen-reduction method of determining oxygen in cast iron. As modified in certain respects by the author, the method is shown by comparative tests to give results in good agreement with those obtained by the hot-extraction vacuum method.
